

# html & css

**Goals:** Familiarize yourself with the basic tags and attributes of HTML websites. Use CSS to define a simple style for the website.

Code your personal page as a single-page website. Use the filename **index.html**. The page must include a header, body, and footer.

## Header

The header must include your name and main occupation (ie, “Software Developer”, “Machine Learning Engineer”, etc). Also include a small profile picture of yourself, in a circular format (use css and the **border-radius** attribute).

## Body

The body must include a short version of your CV/resume, including your personal background (age, location, education), working experience if you have it and your personal interests. Use **divs** and **lists** to organize this content.

## Footer

Finally, the footer should contain links to your profiles on social networking or code repositories. For example, your Linkedin profile, Twitter, Facebook, Instagram, etc. The links should not contain text, but icons (you can grab them from <https://www.flaticon.com/>). But take into account [accessibility](#) as well, and use the **alt** attribute to describe each link (for example **alt="Linkedin Profile"**). You can also add an **alt** attribute for your profile image.

## CSS

Use CSS to style the website, including choosing [background colors](#) for the three sections (header, body, footer) and the main font family and size. Use an [external file](#) for the CSS definitions (don't use internal or inline styles).

**NOTE:** Keep the design in this first version of your website **\*\*VERY\*\*** simple (2 or less hours). We are not expecting you to spend countless hours designing a perfect website. Also, **do not** use external libraries such as **Bootstrap**; this is a practice exercise and we want you to practice the basics.
